

Open Source World Order

“This is our planet. We must all share it.”

“A system for equitable, participatory ownership of our environment.”

I propose a new system of ownership for the planet Earth.

- Fairness in Ownership
- Participation by Interest
- Protection against Manipulation
- Education and Understanding

It is designed to unify humanity's distant future, where every human being is born with a non-transferable share of the space in which they inhabit.

In our case, that is the Earth. In the future, this could extend to moons, other planets, or generation ships travelling between the stars.

By building this system today, we lay the foundation for societies on future planets, moons, and generation ships.

A fairly organised voting system allows people to vote on proposals that interest them, encouraging collaboration, creativity, and ingenuity.

When voting, users face a randomised questionnaire drawn from a pre-built, publicly accessible open-source system.

The questionnaire requires a minimum percentage of correct answers to validate a vote, ensuring users have read the proposal and engaged with the topic, preventing manipulation.

Through active participation in voting and engagement with proposals, each individual helps shape the world we inhabit, promoting accountability, creativity, and shared responsibility.

The volume and randomisation of questions prevent memorisation and encourage genuine understanding of the proposal.

Attempts to manipulate the system are illegal. This system aims to promote true democracy and to educate participants on the issues that matter most to them.

For far too long, humanity has been divided by unequal access to resources and opportunities. This system ensures fairness from birth and encourages participation in decisions that affect our shared environment.

Let this system guide us toward a shared future that is fair, creative, and responsible.
