

Open Source World Order

“This is our planet. We must all share it.”

“A system for equitable, participatory ownership of our environment.”

I propose a new system of ownership for the planet Earth.

- Fairness in Ownership
- Participation by Interest
- Protection against Manipulation
- Education and Understanding

It is designed to unify humanity's distant future, where every human being is born with a non-transferable share of the space in which they inhabit.

In our case, that is the Earth. In the future, this could extend to moons, other planets, or generation ships travelling between the stars.

By building this system today, we lay the foundation for societies on future planets, moons, and generation ships.

A fairly organised voting system allows people to vote on proposals that interest them, encouraging collaboration, creativity, and ingenuity.

When voting, users face a randomised questionnaire drawn from a pre-built, publicly accessible open-source system.

The questionnaire requires a minimum percentage of correct answers to validate a vote, ensuring users have read the proposal and engaged with the topic, preventing manipulation.

Through active participation in voting and engagement with proposals, each individual helps shape the world we inhabit, promoting accountability, creativity, and shared responsibility.

The volume and randomisation of questions prevent memorisation and encourage genuine understanding of the proposal.

Attempts to manipulate the system are illegal. This system aims to promote true democracy and to educate participants on the issues that matter most to them.

For far too long, humanity has been divided by unequal access to resources and opportunities. This system ensures fairness from birth and encourages participation in decisions that affect our shared environment.

Let this system guide us toward a shared future that is fair, creative, and responsible.

Open Source Cryptographically Secure Digital ID System

In order to have a digital ID system which can not be manipulated, I similarly propose an open source cryptographically secure digital ID framework.

To kick-start this system a single anchor must be utilised in order to make initial verifications, currently the only realistic way I can see to achieve this is to sacrifice my own autonomy and opt to be live on stream until enough people become verified that it is no longer necessary.

From there I would independently verify the existence of 10 individuals at a time, then once the pool of verified users hits 1000 a random selection of 10 users can fan out and begin to verify the existence of other individuals adding them to the database.

Because the chances of 10 random users cooperating to manipulate the system by verifying the existence of someone who does not exist is near-zero, the likelihood of anyone attempting to do so falls to zero.

Even if they chose to do so, all it would take is for anyone that is verified at any point in time to express doubt to trigger a re-verification protocol drawing another 10 random users who must verify the existence of the user in question.

This would make it impossible for anyone, even the anchor to act maliciously or verify non-existent users without instantly triggering a fallback where the rest of the verified users turn back around and see the user who attempted to do so.

From there the verification system would fan out and exponentially verify the existence of people to be added to the database, any individual that verifies the existence of another user is logged meaning that if any member of humanity attempts to manipulate the system, all it would take is a single user to register their doubt in the user for every member of the original group that verified them to also be temporarily flagged until the users existence is re-verified or they are proven not to exist, at which point you would know that group of 10 users collaborated to create a non-existent entity within the database.

Then punishment can be administered through the existing legal frameworks, this system is designed to naturally sit on top of the existing governance systems worldwide in order to slowly equalise and balance humanity, guiding us towards a more profitable future for everyone.

The overall goal is to reorient the system towards more natural incentives, such as honesty.

It could also eventually serve as a social credit system which would also be impossible to manipulate, rendering the dangers of social credit systems inert.

In this form of the social credit system there would only be negatives, so that anyone who manipulates the system or even attempts to do so gets a mark on their name.

This should naturally align humanity towards a future where people simply do not try.

I simply don't see a way to give positive marks because the reasoning for giving positive marks could become arbitrary or opinion based, regardless of how it is verified.

So register your vote now! Spread the word and tell people that you want your Earth certificate!
